

Datasheet

Butterfly valve

VSS LN (Low Noise)

Si-211 EN

Edition: 2020-04

- Advanced triple eccentric design
- Designed for control applications
- Designed for applications up to 550° C (1022° F)
- Solid seat made of stainless steel
- Tightness class in accordance with EN 60534-4 class V as standard
- Trim for noise reduction

Type VSS LN (Low Noise)

Product Information

The SOMAS butterfly valve, type VSS LN, is a control valve. With a low noise trim, type LN, flashing and cavitation problems can be eliminated and a lower noise level achieved. The valve is designed to handle a wide range of liquids, gases and steam at temperatures up to 550°C (1022°F).

The VSS LN-valve is designed to be mounted between flanges.

The valves have an advanced triple eccentric design including a unique shape of the disc allows the use of a solid stainless steel seat. The solid seat remains unaffected by high flow velocities and a good valve function is achieved even on difficult applications.

The SOMAS valves are delivered ready for installation and operation.

The valve assemblies are tested as complete units with actuators, positioners and accessories.

Tightness class

The tightness class is related to the chosen material in the seat ring.

Standard leakage class	Optional leakage class
EN 60534-4	EN 60534-4
PTFE - Class V	PTFE - Class VI
Metal - Class V	
	EN 12266-1
	PTFE - Rate B
	PTFE - Rate C
	Metal - Rate D

Temperature range

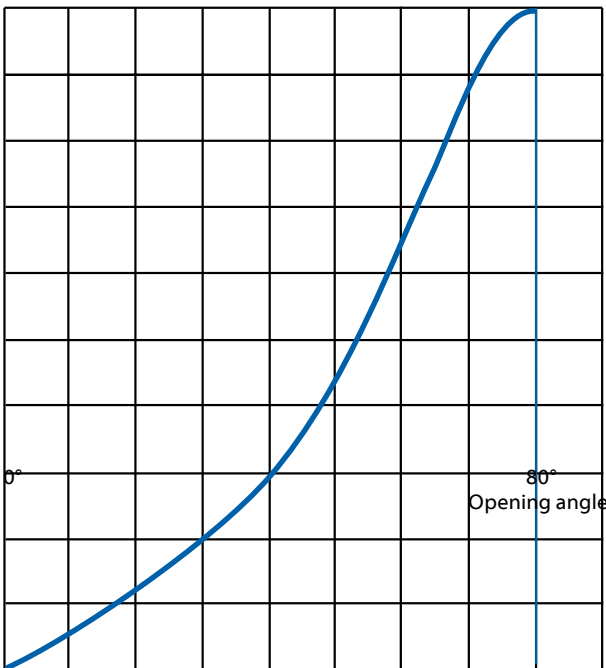

For applications up to 550° C (1022° F).
 Minimum working temperature -60°.
 If lower temperatures are needed contact SOMAS.

Flange standard

The SOMAS butterfly valve type VSS LN in this datasheet is of wafer type for mounting between flanges PN 10, PN 16, Class150 and PN25. When ordering, please state the pressure rating of the counterflanges. See valve specification system, code 13.

Flow characteristics

100% Flow

Face to face

Face to face according to the EN 558 series 20.

Background

Within the process industry and the energy sector there are a number of applications where process data in combination with standard control valves will result in problems such as erosion and high noise level.

These problems are usually related to high flow velocities and/or pressure drops within the valve caused by the severe nature of a given process's requirement.

By using a standard butterfly valve and adding the SOMAS noise reduction device many severe noise-producing applications can be solved.

Theory

The risk of cavitation is high in liquid applications when combined with high-pressure drops.

Cavitation is a two-stage phenomenon caused by the fluid undergoing two changes of state. The initial pressure of the liquid is reduced to a value below its vapour pressure as it passes through a restriction (valve). This pressure reduction causes vapour voids or bubbles to form, the pressure then recovers to a value greater than the liquid's vapour pressure, causing the voids to collapse or implode back into an all-liquid state. The cavitation process is always accompanied by high noise and if left to itself, will cause severe damage to both the control valve as well as its proximate downstream piping and/or fittings. The second stage is the collapse or implosion of these cavities back into an all-liquid state.

In order to visualize how these phenomena occur in control valves, consider a liquid flowing in a piping system in which a restriction such as a concentric orifice has been placed. In this case, the orifice may be considered analogous to a control valve at some fixed opening. Fig. 1 illustrates the pressures and velocities along the flow stream.

As the fluid stream approaches the restriction in the line, its cross-sectional area must decrease in order to pass through the orifice. The velocity is inversely proportional to the stream area and, therefore, must increase. Immediately downstream of the orifice the stream will reach its minimum cross-section and thus its maximum velocity. This point is called the vena contracta. If the velocity is increased sufficiently, the pressure will fall to the vapour pressure, thus permitting the formation of voids in the stream, which is the first stage of cavitation.

Downstream of the vena contracta, fluid friction

Fig. 1

causes the stream to decelerate with resultant increases in both stream cross-section and pressure. This reversal of energy interchange between the velocity and "pressure recovery" plays an important role in valve sizing.

Vapour bubbles, formed by reducing the pressure at the vena contracta to the vapour pressure, cannot exist at increased pressure downstream and are forced to collapse or implode back into the liquid state.

Should the pressure in the downstream piping system be maintained at a level equal to or less than the inlet vapour pressure, the fluid proceeding downstream would have an increased percentage of vapour. The velocity of the stream would continue to increase and the end result would be flashing rather than cavitation.

Gas

For installations on steam and gas, the noise level is related to high flow velocity due to high differential pressure across the valve. This will normally not influence the lifetime of the valve.

The coverplate on the inlet side as well as the diffuser plate in the outlet of the valve will split up the pressure drop, and the flow velocity inside the valve will be lower. As a result of this, less noise is generated noise.

Fig. 2 Pressure and velocity variations with noise reduction trim. Compare with Fig. 1

Valve description

SOMAS butterfly valve type VSS LN is derivative of the standard butterfly valve type VSS. The designation "LN" indicates that the valve is equipped with a noise reduction device which is used to split up the pressure drop across the valve. The result is less pressure recovery, thereby reducing the noise and potential cavitation damage normally generated in a standard butterfly valve (See fig.2).

Temperature range

Seat	Max. temp.
A = PTFE (10 % carbon)	170° C 338° F
D = 1.4462 (metal seat type Y)	350° C ¹ 661° F ¹ 550° C ² 1022° F ²

Shaft	Max. temp.
A = 1.4460	150° C 302° F
B = 1.4460, hard chromed	350° C ¹ 662° F ¹ 550° C ² 1022° F ²
C = 1.4460, HiCo coated	350° C ¹ 662° F ¹ 550° C ² 1022° F ²

Valve body	Max. temp.
A = CF8M	550° C 1022° F

¹ Check with SOMAS for temperatures between 350° C (662° F) and 550° C (1022° F). At higher pressures for example steam turbine applications.

² At lower pressures for example exhaust applications.

Minimum working temperature -60°.

If lower temperatures are needed contact SOMAS.

Supplemental information

Note: Use gaskets with the correct inside diameter to ensure that pressure is applied on the cover plate.

For mounting between flanges according to PN 10-25, the inside gasket diameter should not exceed the dimensions specified in the standard EN 1514-1.

Gaskets according to EN 1514-1

Valve DN	Max. Inside dia. di (mm)	Outside dia. (dy) (mm)		
		PN 10	PN 16	PN 25

18	18,00	21,65
20	20,00	23,86
24	24,00	28,35

Further technical information

Technical data for the materials used in the SOMAS valves, flange standard, steam data, etc. can be found in documents library on www.somas.se.

Valve sizing

Use SOMAS valve sizing program SOMSIZE for valve sizing. All factors needed for the sizing are included in the program.

Ordering

State desired valve according to the valve specification system below as well as type of actuator, positioner and accessories.

Actuators and accessories

The valves can be fitted with SOMAS manual, on/off or control actuators in accordance with the selection table. The valves will then be delivered as tested units ready for installation.

In the documents library on www.somas.se there is also information about positioners, limit switches and solenoid valves.

We can also fit other types of actuators and accessories in accordance with your specification.
